

# More visibility. Less chasing.

Reduce the cost of chasing contractor updates. Keep your team, contractors and job updates connected through one central system of record.

## Less administration

See booking and job progress without another round of calls and emails.

## One job record

Keep attendance, checks and completion documents connected to the works order.

## Tenant reassurance

Share the expected engineer's identity and keep pre-work safety records visible.

A clearer view of the job, from instruction to completion.

# From instruction to a complete record.

## 01 Raise and distribute the work.

Create the works order and pass it to a contractor with the property and work details together.

## 02 Answer progress questions with context.

Follow the booking and job status. Give landlords and tenants an update from the shared record.

## 03 Know who attended and what was checked.

Use live engineer ID cards and recorded pre-work H&S assessments and RAMS (risk assessments and method statements) to support oversight.

## 04 Find the paperwork against the job.

Access available certificates, quotes and invoices alongside the attendance and visit history.

Shared visibility depends on participating contractors keeping records up to date. Digital records support oversight; they do not replace competent risk assessment or your organisation's safety responsibilities.

## See your own workflow.

Bring an anonymised works order.

Start with a short introduction on Google Meet.
